there is a long standing evolutionary battle between viruses and their hosts that continues to be waged the evidence of this conflict can be found on both sides with the human immune system being responsive to new viral challenges and viruses having developed often sophisticated countermeasures the arms race between viruses and hosts can be thought as an example of the red queen race an evolutionary hypothesis inspired from the dialogue of alice with the red queen in lewis carroll s through the looking glass at the same time viruses have a minimal genomic content as they have evolved to hitchhike biological machinery of their hosts or other co infecting viruses the minimalistic viral genome could be thought as the result of a black queen evolution a theory inspired from the card game heart where the winner is the one with the fewest points at the end the effects of this arms race are evident in the evolution of the human immune system this system is capable of responding to diverse viral challenges utilizing both the ancient innate immune system and the more recently evolved adaptive immune system of jawed vertebrates it is now well known that the two systems are linked with innate immunity hypothesized to have provided raw material for the emergence of the adaptive immune response the adaptive immune response comprises several protein families including b and t cell receptors mhc and kir proteins for example that are encoded by complex and variable genomic regions this complexity enables for responsive genetic changes to occur in immune cells such as the ability of genomic hypervariable regions in b cells to recombine in order to produce more specific antibodies indeed the human immune system is thought to be continually evolving via various mechanisms such as changes in the genes encoding immune receptors and the regulatory sequences that control their expression for example there is some evidence that exogenous viral infections can alter the expression of endogenous retroviruses some of which contribute to the immune response viral countermeasures can include encoding decoy receptors for the signalling molecules of the immune response altering the gene expression of adaptive immune cells during chronic infection or using host enzymes to facilitate viral immune escape as the articles herein show the immune system continues to be challenged by viral infections and these challenges continue to shape how the immune system combats pathogens thus viruses and human immunity are continuously part of red and black queen evolutionary dynamics we had the pleasure of working with jonas blomberg as a reviewer during the course of the research topic and his untimely passing was a great loss prof blomberg made significant contributions including to the nomenclature of endogenous retroviruses ervs the evolution and characterization of specific human erv herv and the contribution of ervs to diseases such as cancer it is with great respect for his contributions to the erv field that we dedicate this ebook to his memory

the evaluation was performed by comparing building simulations provided by micro programs to those provided by the building loads analysis and system thermodynamics blast program the two micro programs chosen for evaluation opcost and saseap are representative of the type of bin method calculations used in simplified energy analysis procedures the evaluation was based on four factors 1 the ability of the programs to calculate overall annual building energy consumption 2 their ability to study design options for developing energy efficient new construction 3 their ability to calculate energy savings from various building retrofit options and 4 the amount of input information required which would be considered judgemental in nature as opposed to building description oriented the results of the evaluation showed that the microcomputer energy analysis programs could reasonably predict the proper ranking of design alternatives or retrofit options however the programs could not accurately predict total annual energy consumption thus the micro programs should not be used to determine compliance with energy budgets likewise the micro programs could not predict the actual energy savings due to a design alternative or a retrofit option the results did not clearly illustrate which design options were modeled accurately
